

CLINICAL GUIDELINE

Infection Management, Empirical Antibiotic Therapy in Adults

A guideline is intended to assist healthcare professionals in the choice of disease-specific treatments.

Clinical judgement should be exercised on the applicability of any guideline, influenced by individual patient characteristics. Clinicians should be mindful of the potential for harmful polypharmacy and increased susceptibility to adverse drug reactions in patients with multiple morbidities or frailty.

If, after discussion with the patient or carer, there are good reasons for not following a guideline, it is good practice to record these and communicate them to others involved in the care of the patient.

Version Number:	10			
Does this version include changes to clinical advice:	Yes			
Date Approved:	29th August 2023			
Date of Next Review:	31 st August 2026			
Lead Author:	Ysobel Gourlay			
Approval Group:	Antimicrobial Utilisation Committee			

Important Note:

The Intranet version of this document is the only version that is maintained.

Any printed copies should therefore be viewed as 'Uncontrolled' and as such, may not necessarily contain the latest updates and amendments.

Hospital Infection Management Guidelines Empirical Antibiotic Therapy in Adults

STOP AND THINK BEFORE ANTIBIOTIC THERAPY: 1 in 5 antimicrobial courses associated with adverse events including C.difficile, drug interactions/ toxicity, device related infections and & aureus bacteraemia. THINK SEPSIS if NEWS 2 5. Send samples to microbiology before starting antibiotics. RECORD antimicrobial indication and duration on HEPMA REVIEW patient and results. RECORD clinical response and prescription daily. Can you SIMPLIFY, SWITCH or STOP? If Clinical improvement + eating/drinking + deep seated/complex infection not suspected then IVOST (See IVOST Guidelines) and RECORD duration of remaining oral therapy, RECORD the STOP date for oral antimic robial on HEPMA

REVIEW all IV antimicrobial and prescription DAILY and RECORD duration / review date. INFORM patient of reason for antimicrobial and likely duration.

drial mutation A1555G

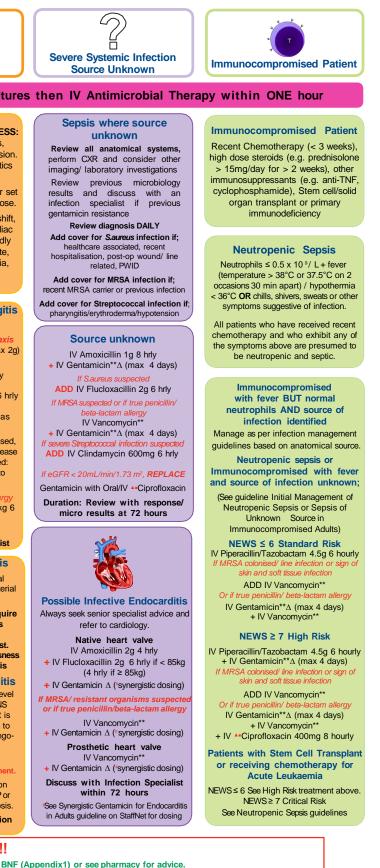

NB Doses recommended based on normal renal/liver function - see BNF or Renal handbook for dosing advice. For info on antimicrobial contra-indications, cautions and monitoring see BNF.

Definition of SEPSIS: INFECTION (includes Systemic Inflammatory Response Syndrome (SIRS*)) WITH evidence of ORGAN HYPOPERFUSION (> 2 of: Confusion, < 15 GCS or Resp Rate ≥ 22/ min or Systolic BP ≤ 100 mm Hg). Ensure SEPSIS 6 within one hour: 1. Blood cultures (& any other relevant samples), 2. IV Antibiotic administration, 3. Oxygen to maintain target saturation, 4. Measure lactate, 5. IV fluids, 6. Monitor urine output hourly. *SIRS indicated by Temp < 36°C or > 38°C, HR > 90 bpm, RR > 20/ min & WCC < 4 or > 12 x10^o/ L. SIRS is not specific to bacterial infection (also viral & non-infective causes).
